Earle C. Chambers, PhD, MPH  
Associate Professor of Family and Social Medicine

Research Summary:

My work examines the role of housing policy and the household environment on cardiovascular disease risk in racial/ethnic minority populations. I have expertise in the intersection of the built and social environments on CVD risk. There has been an effort in the field of the built environment and health to place health behaviors in the proper social context in order to better understand the racial, ethnic, and economic disparities in chronic disease outcomes. My work has moved this science forward using the socio-ecologic model as the framework to understand health disparities.

In addition, I am interested in linking primary care and public health using metrics that facilitate a better understanding of how clinical care and community health can work synergistically to promote population health.
